hypothesis-driven and hypothesis-generating. Hypothesis-driven studies involve formulating a specific hypothesis and designing experiments to test it, whereas hypothesis-generating studies aim to identify new hypotheses through exploratory data analysis.

This page contains a continuation of the previous text. It discusses the progression of studies and the evolution of research techniques in the field. The text highlights the importance of interdisciplinary collaboration and the role of technology in advancing scientific understanding.

The page also includes a citation from a scientific paper, indicating the source of the information presented. The citation provides a reference to a specific study or article, which likely contributes to the information discussed on this page.

The page ends with a brief note from the author, expressing gratitude for the support and contributions of various individuals or organizations. This note is a common feature in scientific publications, acknowledging the collective efforts involved in the research.

In summary, this page is part of a scientific manuscript that explores the development of research methodologies and their impact on scientific progress. It underscores the value of hypothesis-driven and hypothesis-generating approaches and recognizes the importance of collaboration and technological advancement in scientific endeavors.
were still in the early clinical trials.\textsuperscript{14} What should be altered is that target therapy with BET inhibitors could change the cytopathologic and immunohistochemical features of the tumor cells and be deceivable in the estimation of tumor recurrence.\textsuperscript{15}

In summary, we present an unusual case of NMC in a Chinese boy. NMC should be considered in the differential diagnosis of any undifferentiated carcinoma. The rapidly exacerbated course without effective therapy makes the prognosis dismal. The establishment of the International NUT Midline Carcinoma Registry in 2010 promoted the international cooperation and the clinical trial of target therapy was conducted which may bring the light of hope to this kind of patients.
